PRESENTACION

La necesidad de elevar los resultados de los estudios de audiencia a valores de población obliga a realizar cada año la actualización del universo de referencia con objeto de no incurrir en la obsolescencia que supondría trabajar estrictamente con datos censales. Los largos periodos entre censos hacen que cada año sea necesaria una nueva estimación del universo a partir de proyecciones demográficas.

AIMC ha venido haciendo esta estimación para aplicarla a los resultados del Estudio General de Medios. Numerosas consultas de sus asociados impulsaron en los últimos años a elaborar y distribuir un documento en el que se recogían los datos principales de dicha estimación. En dichos años se han multiplicado las consultas a AIMC sobre esta materia no solo de asociados sino de otras instituciones que utilizan las estimaciones de AIMC como datos de referencia para otros trabajos. Ello constituye una satisfacción y simultáneamente un compromiso de mejora.

Así, el documento que ahora se presenta con los “Universos del Estudio General de Medios, 2009”, recoge un análisis más detallado de la población, tanto de la que constituye estrictamente el universo EGM como de la población total así como información útil sobre el tamaño de los hogares.

Se trata en definitiva de un trabajo de recopilación de los datos de población proporcionados por los organismos públicos competentes, a los que se añaden estimaciones propias, presentados de forma que permitan la aplicación directa, y que AIMC pone a disposición de sus asociados y de la comunidad investigadora en general.

Enero 2009

FICHA TECNICA

Fuentes y presentación de resultados

Los datos que se adjuntan constituyen el **marco referencial básico** de población para la investigación EGM 2009 y resultan de la elaboración que AIMC ha realizado a partir de las siguientes fuentes:

- Censo de Población 2001 - INE.
- Padrón Municipal 2006 y 2007 – INE.
- Proyecciones de la población a corto plazo 2007-2015 - INE (16 enero 2008).
- Estimaciones de la población actual 2002-2008 - INE (21 julio 2008).

Para clasificar los municipios por tamaño de hábitat se ha tenido en cuenta la población que tenían en el Censo de 2001.

Todas las cifras de población consignadas se refieren siempre a población el día 1 de enero de 2009.

La población objeto de estudio por parte de EGM son los individuos de 14 años o más que residen en la España peninsular, Baleares y Canarias.

Dadas las características de estudio muestral que el EGM tiene, la congruencia entre el tamaño del universo estimado a través del propio estudio y el dato de referencia equivalente consignado en este documento, solo se pretende a niveles globales, de acuerdo con las condiciones de equilibraje utilizadas en el proceso.

Metodología

La estimación para el año 2009 está basada en la “Proyecciones de la población a corto plazo” que ha realizado el INE publicadas el 16 de enero de 2008. Se ha optado por el escenario más bajo de esta estimación ya que es el que se aproxima más al dato de “Estimación de la población actual” del INE publicada el 21 de julio de 2008.

Como el último dato publicado de “Estimaciones de la población actual” está referido a 1 de Julio de 2008, estimamos la población de 1 de enero de 2009 a través de los datos de “Población Actual” de 1 de enero de 2008 y 1 de julio de 2008.

Con esto disponemos de la cifra de total población por provincias y sexo.

Para calcular los desgloses por edades partimos de la distribución por edad de los padrones de 2006 y 2007. Calculó para las edades de 1 a 84 años el índice entre una edad “n” en 2006 y la edad “n+1” en 2007. Este factor se utilizará para estimar el número de personas de cada edad en 2008 y después en 2009. La edad “n” de 2008 se calcula como la edad “n-1” en 2007 por el factor de conversión de edad “n” entre 2006 y 2007.

Para el último bloque “85 y más” considero el factor de paso de 2006 a 2007 de “85 y más” pero se lo aplico a la suma de la edad “84” y “85 y más” de 2007.

Si se repite este proceso sobre los datos obtenidos con el paso anterior se obtiene una estimación de los individuos de 2009 por edades.

Solo falta la estimación para las edades 0 y 1, ya que el sistema anterior no proporciona dato para ellas. Para cubrir ese hueco se ha tomado este dato de la estimación de la población a corto plazo para esas edades.

Una vez realizados estos cálculos se obtiene un índice entre los datos de cada edad y sexo del 2007 y los estimados para 2009. Este índice se aplica ahora a los datos de cada provincia, sexo y edad del padrón 2007.

Y por último se corrigen las diferencias entre los datos totales por sexo y provincias, multiplicando cada edad independiente por el factor necesario para que resulte la población de la estimación de Población Actual.

Para establecer el tamaño de hábitat de cada municipio se considera la cifra de población que proporciona el Censo de 2001. El tamaño de hábitat de un municipio no cambia con la proyección de la población al año 2009; seguirá teniendo el tamaño correspondiente al Censo de 2001.

Para la distribución de la población por tamaño de hábitat se mantienen las proporciones del Censo de 2001. Esta estructura de hábitat se aplica al total individuos de cada cruce provincia-sexo. Para la distribución por hábitat de la población de 14 o más años mantenemos la suposición de idéntica distribución por hábitat que el total de la población.

El número total de hogares se ha calculado en base a la población de la proyección de la población, y fijando un promedio de 2,75 individuos por hogar. La distribución por comunidades se ha realizado partiendo de la distribución de individuos por hogar del censo de 2001, ajustándola para que la suma de total nacional diese este promedio de 2,75 individuos por hogar.

Por último para el cálculo de la distribución de los hogares según el número de miembros de 14 años o más, se ha utilizado la información sobre tamaño de hogar que proporciona el EGM ajustando cuando es preciso por Comunidad Autónoma.
