## PRESENTACION

La necesidad de elevar los resultados de los estudios de audiencia a valores de población obliga a realizar cada año la actualización del universo de referencia con objeto de no incurrir en la obsolescencia que supondría trabajar estrictamente con datos censales. Los largos periodos entre censos hacen que cada año sea necesaria una nueva estimación del universo a partir de proyecciones demográficas.

AIMC ha venido haciendo esta estimación para aplicarla a los resultados del Estudio General de Medios. Numerosas consultas de sus asociados impulsaron en los últimos años a elaborar y distribuir un documento en el que se recogían los datos principales de dicha estimación. En dichos años se han multiplicado las consultas a AIMC sobre esta materia no solo de asociados sino de otras instituciones que utilizan las estimaciones de AIMC como datos de referencia para otros trabajos. Ello constituye una satisfacción y simultáneamente un compromiso de mejora.

Así, el documento que ahora se presenta con los “Universos del Estudio General de Medios, 2010”, recoge un análisis más detallado de la población, tanto de la que constituye estrictamente el universo EGM como de la población total así como información útil sobre el tamaño de los hogares.

Se trata en definitiva de un trabajo de recopilación de los datos de población proporcionados por los organismos públicos competentes, a los que se añaden estimaciones propias, presentados de forma que permitan la aplicación directa, y que AIMC pone a disposición de sus asociados y de la comunidad investigadora en general.

Enero 2.010

## FICHA TECNICA

### Fuentes y presentación de resultados

Los datos que se adjuntan constituyen el **marco referencial básico** de población para la investigación EGM 2010 y resultan de la elaboración que AIMC ha realizado a partir de las siguientes fuentes:

- Padrón municipal Población a 1 de enero de 2008 - INE.
- Estimaciones de la población actual dato a 1 de octubre 2009 INE.
- Encuesta de Población Activa - Tercer trimestre 2009 INE.

Para clasificar los municipios por tamaño de hábitat se ha tenido en cuenta la población que tenían en el Padrón Municipal de 2008.

Todas las cifras de población consignadas se refieren siempre a población el día 1 de enero de 2010.

La población objeto de estudio por parte de EGM son los individuos de 14 años o más que residen en la España peninsular, Baleares y Canarias.

Dadas las características de estudio muestral que el EGM tiene, la congruencia entre el tamaño del universo estimado a través del propio estudio y el dato de referencia equivalente consignado en este documento, solo se pretende a niveles globales, de acuerdo con las condiciones de equilibraje utilizadas en el proceso.

## Metodología

El cálculo para el año 2010 está basado en la “Estimaciones de la población actual” que ha realizado el INE.

El último dato publicado de “Estimaciones de la población actual”, a tiempo para realizar esta estimación, está referido a 1 de Octubre de 2009. Teniendo en cuenta que a diferencia de los últimos años, las variaciones trimestrales son muy pequeñas, hemos preferido considerar mantener este dato como el de 1 de enero de 2010.

De esta manera disponemos de la cifra de total población por provincia, sexo y edad año a año.

Para establecer el tamaño de hábitat de cada municipio se considera la cifra de población que proporciona el Padrón municipal de 2008. El tamaño de hábitat de un municipio no cambia con la proyección de la población al año 2010; sigue teniendo el tamaño correspondiente al Padrón de 2008.

En la distribución de la población por tamaño de hábitat se mantienen las proporciones del Padrón 2008. Esta estructura de hábitat se aplica al total individuos de cada cruce provincia-sexo. Para la distribución por hábitat de la población de 14 o más años mantenemos la suposición de idéntica distribución por hábitat que el total de la población.

El cálculo del número de hogares se ha basado en los datos publicados por el INE de la Encuesta de población activa. De esta encuesta disponemos del fichero de datos desagregados con factor de individuo para todos los miembros del hogar, de forma que se puede obtener un factor de hogar para el tamaño total de individuos en el hogar y para el tamaño de los de 14 años o más, que son los dos que necesitamos.

Hemos calculado el promedio de individuos por hogar a nivel de cada provincia, y aplicado este factor al número de individuos, que ya habíamos calculado, proporciona el número de hogares. A este número de hogares se le aplica la distribución por tamaño de hogar obtenida anteriormente de la EPA. A nivel de toda España el promedio de individuos por hogar es de 2,74.

De forma similar se ha calculado la distribución de hogares por tamaño de hogar según los individuos de 14 años o más en la EPA y aplicando nuevamente esta distribución por provincia a los individuos de 14 años o más se obtiene la distribución de hogares, que da un promedio de individuos por hogar de 2,36 individuos de 14 años o más por hogar.
